

GREATARIO tanks withstand the test of time

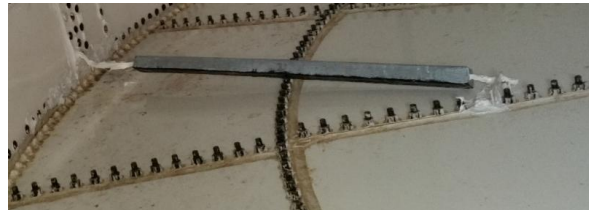

A premium tank coating process that does not deteriorate and never needs repainting continues to "raise the bar" in municipal and industrial liquid storage application standards.

However, even with the highest quality of glass-fused-to-steel coatings, we recommend that periodic inspections are completed on a consistent basis as a good preventative maintenance policy. Regular inspections will help to identify potential concerns before they become problems. Interior and exterior inspections are good precautionary measures to keep your tank in proper operating condition.

CATHODIC PROTECTION

Ensuring the continued effectiveness of the tank's cathodic protection system is essential to extending the life of the tank. The cathodic protection system consists of sacrificial anodes that provide protection to internal submerged surfaces of the tank. The rate at which these bars degrade must be monitored regularly to ensure that adequate protection is being provided to the internal surfaces of the tank. The system is simple, reliable and requires only minimum inspection and maintenance. Much like the oil in your car, it is a key component to the tank's operation and regular testing is recommended.

GREATARIO SERVICES

Scott Plant, Greatario Services Manager continues to connect with owners of Greatario tanks to schedule interior and exterior tank inspections. Greatario provides extended maintenance contracts to evaluate, plan and provide all maintenance and repairs needed for the water storage tank on an ongoing sustainable basis.
